Replacing the Bulb in an OceanOptics Lamp

**Materials:**
- Small Hex Key
- Large Hex Key
- Flathead Screwdriver

Remove the 3 screws on the back of the lamp.

Remove the back from the lamp. Be careful not to pull the small wires out of their connections inside the lamp.

Loosen the screw found in between the fan blades, but do not completely remove it.

This will allow you to take the bulb out of the lamp.

Unscrew the bulb connections, taking note of which color wire goes in which hole.
Replace the old bulb with the new one by connecting the wires in the corresponding holes.

Position the new bulb inside of the lamp.

While holding the bulb in place, tighten the screw found in between the fan blades.

Replace the back of the lamp. Be sure to keep all wires away from the fan blades.

Reattach the back of the lamp with the 3 screws. The lamp is now ready for use.
